Abstract   A life at the typical U.S. department present-days involves large number of contingent faculty who are assigned to teach significant number of service courses possibly even a two-three days before the start of the term. Instead on relaying on them to write their Syllabi I would prefer to have those generated by person in charge for teaching with as little input from other humans as possible. In this article we describe a design of an Automatics Syllabus Generator.

Place holder since we will have to have code! Just want to add some text so that you can see how is going to look like. Best Predrag...

```
#include
#include

int main()
{
std::cout << "Hallo Welt!" << std::endl;
}
```
